

Duons Launches SRMAX Add-on Module for Broadband Upgrade.

Paris, 10th of February 2012

DUONS is proud to announce the launch of the SRMAX Module for broadband upgrade. This solution enables Duons Telecom Networks owners (SR500, SWING and IRT) to multiply by six the bandwidth of their networks and therefore access all broadband services at the lowest possible cost.

With over 5000 telecom networks installed in 130 countries during the past 30 years, Duons remains a key partner for telecom operators, network integrators and industrial end users. Thanks to the exceptional characteristics of its products (robustness, scalability, ease of use, wide coverage and native repeater function) those networks are providing reliable services today.

In order to extend even further the life cycle of its networks, Duons has developed the SRMAX Add-On module for broadband upgrade. This enables customers to enjoy new services with the lowest possible impact on their existing infrastructure & running network while maintaining the native repeater function :

Developed as an Add-on module, SRMAX^R is coupled to existing radio installations and enables high capacity broadband: All existing SR500, SWING & IRT networks can now benefit from an additional 2 x 20Mbps data trunk.

Being a plug and play module, SRMAX is fully integrated into existing networks and does not require any hardware or software upgrade. Duons Telecom Networks owners can now access support for high data rate IP devices and solutions (CCTV, Voice over IP, LAN extension...)

Thanks to the technological innovation created by the Duons R&D Team with the assistance of OSEO (French Government Agency for Innovation) , installing SRMAX^R does not require any modification of the existing infrastructure and takes up a unique position as a **low-cost broadband solution for Duons Microwaves equipment owners.**
